

Post Tropical Cyclone Sandy Geospatial Response

An Interagency Success Story and NOAA's Role

February 26, 2014

FEMA

Pre-Storm Coordination

- FEMA
- USGS
- NOAA
- Civil Air Patrol (DoD)
- National Geospatial-Intelligence Agency (NGA)

Pre-Storm Preparation

- FEMA Modeling Task Force (MOTF) ran predicted surge models (SLOSH)
- USGS
 - Deployed hundreds of storm surge sensors to measure depth of water at structural level
 - Included real-time surge, rapid-deployment gages
 - These sensors provided a real-time assessment as the storm made landfall
- NOAA and NGA prepared to collect imagery after storm
- CAP had aircraft and crews ready to fly

FEMA

Sandy Response

- NOAA overflights
 - Used surge models to target high-priority areas
 - Geospatially referenced, GIS-ready imagery
 - High resolution
 - Priorities:
 - Impacts to nautical charting and the marine transportation system
 - Impacts to the coastal zone
 - MOTF priorities
 - First flight was posted and available within 48 hours

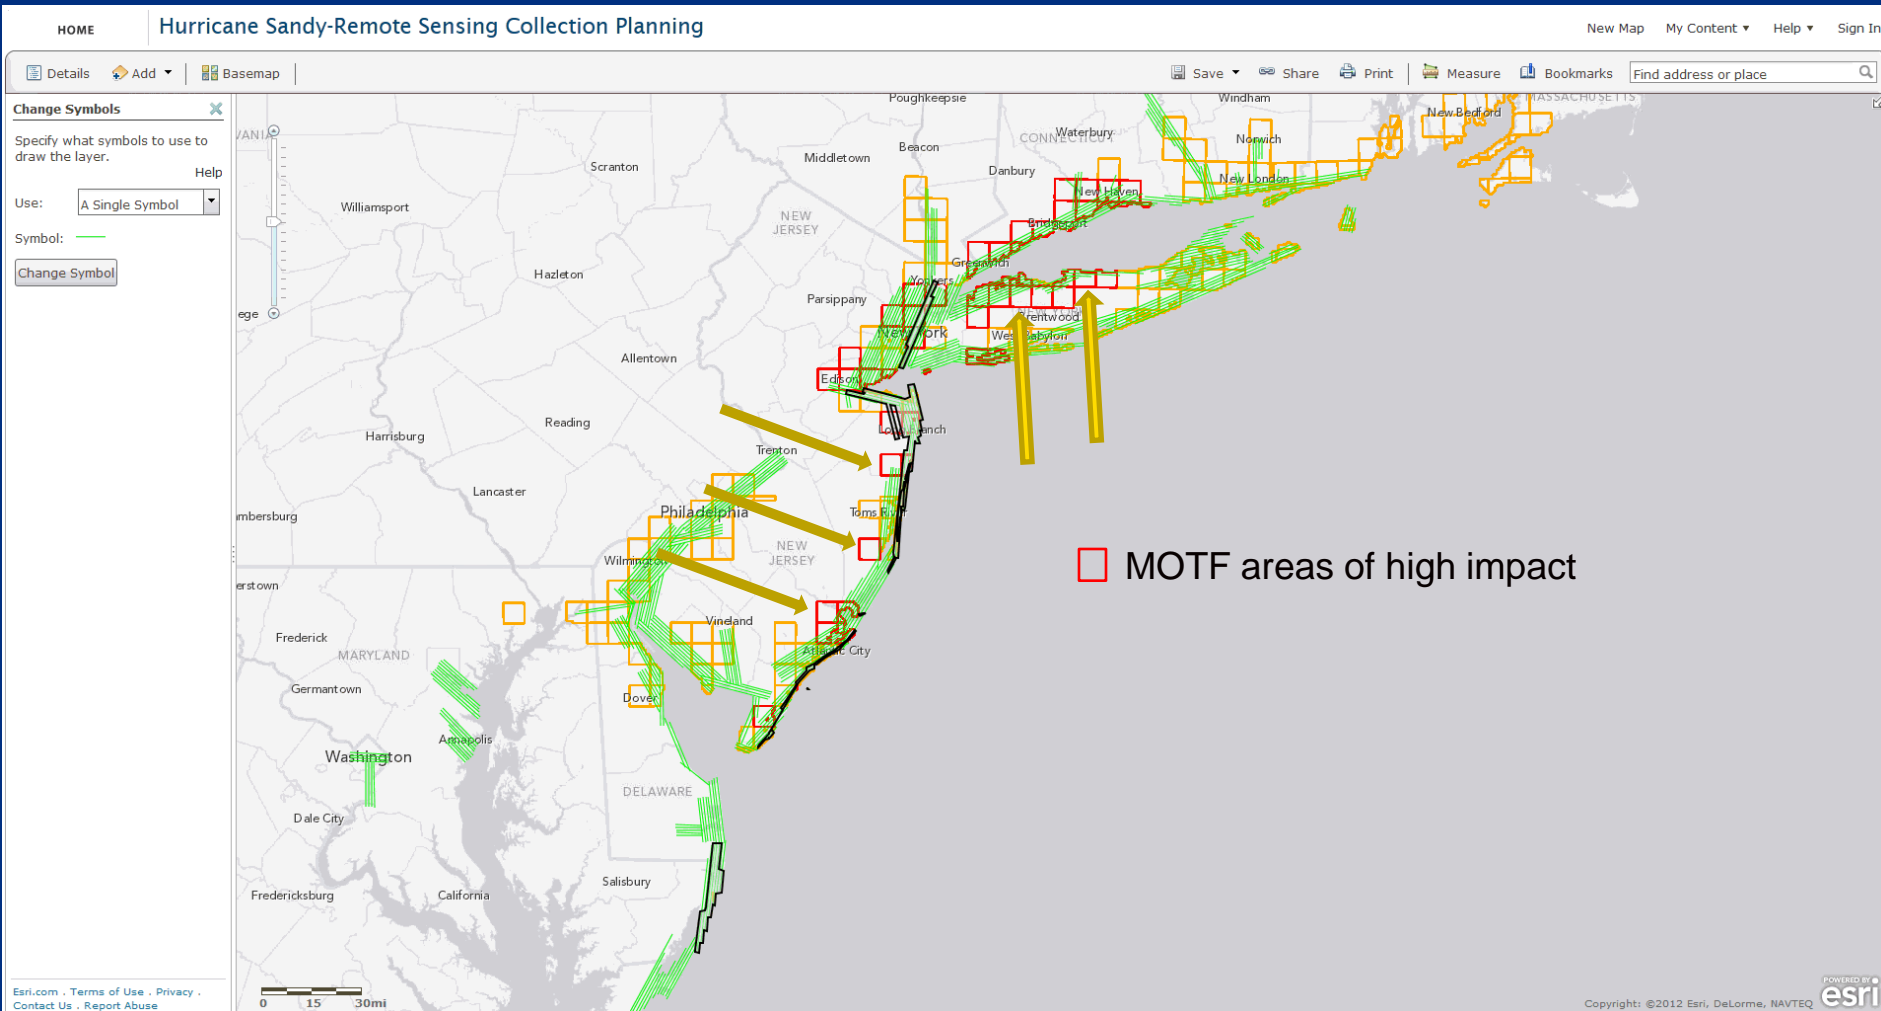

Imagery collected by NOAA

FEMA

NOAA planned flight lines and collected data overlaid on MOTF Risk Matrix and Priority setting for 1-2 Nov

Black outline = data collected Green lines = planned collection Blue Boxes = priority areas for 1-2 Nov

- Contents**
- sandy ngs rsd
 - 20121101 ngs rsd
 - 20121031 ngs rsd
 - EAARL-B post-Sandy
 - NGTOC post-Sandy lidar
 - sandy dss fit lines
 - Sandy Images
 - Collected CAP Imagery
 - CT CAP
 - Remote Sensing Plans
 - NOAA 20121031
 - Sandy Surge Extent
 - MOTF Risk Matrix
 - Light Gray Canvas

Lines inland to Be completed

Black outline completed Flight lines

FEMA

Sandy Response

- Hind-cast SLOSH - models were refined using:
 - Sensor Data
 - 850 High Water Marks collected by USGS

FEMA

Storm Impacts

Before

Post-Storm

- Mantoloking, NJ
- Barrier Island Breach

FEMA

Storm Impacts

FEMA

Storm Impacts

Before

Post-Storm

- Mantoloking, NJ
- Barrier Island Breach

FEMA

Storm Impacts

FEMA

Sandy Response

- CAP Flights
 - Oblique, geo-tagged aerial of most impacted areas
 - Used surge model to prioritize flights
 - In air within 24 hours of storm
 - Over 157,000 geo-tagged images captured
 - Over 650 sorties flown
 - Over 250 personnel, including headquarters staff, were in support

FEMA

Sandy Response

- Structural Assessments by ImageCAT, using NOAA and CAP imagery and surge model
 - 44,000 assessments delivered within 72 hours notice to proceed
 - 147,000 individual structural assessments in total
- Geospatial Structural Assessments were used to:
 - Deliver expedited assistance to >44,000 applicants for temporary shelter assistance
 - Determine priorities for Housing Inspection teams
 - Direct operational forces to be concentrated on most impacted areas allowing a stretched response effort to maneuver without wasting man-hours or effort
 - Determine potential long-term housing requirement priority areas to support IA Housing planning efforts in NJ/NY

FEMA

FEMA use of NOAA Imagery for Damage Assessment of Individual Homes

The screenshot shows a web browser window displaying an ArcGIS application titled "Hurricane Sandy-Remote Sensing Collection Planning". The browser address bar shows the URL: `fema.maps.arcgis.com/home/webmap/viewer.html?webmap=792c0761b50a417fbb3eb61a58f43a60`. The application interface includes a top navigation bar with "HOME", "New Map", "My Content", "Help", and "Sign In". Below this is a toolbar with "Details", "Add", "Basemap", "Save", "Share", "Print", "Measure", and "Bookmarks". A search bar is located on the right side of the toolbar.

The main map area shows a satellite-style view of a residential area with a grid of streets. Overlaid on the map are numerous colored circular markers representing individual homes. The legend on the left side of the map, titled "Contents", lists the following layers and symbols:

- ImageCat NLT
 - point_result_20121101_14
 - damage_20121101_1450P
 - Destroyed (Red)
 - Major (Orange)
 - Minor (Yellow)
 - Affected (Light Green)
 - No Damage (Dark Green)
 - Unknown (Grey)
- CT CAP
- Remote Sensing Plans
- NOAA 20121031
- Sandy Surge Extent
- MOTF Risk Matrix
- Light Gray Canvas

At the bottom of the map, there is a scale bar and a copyright notice: "Copyright: ©2012 Esri, DeLorme, NAVTEQ | New Light Technologies / ImageCat". The Esri logo is visible in the bottom right corner of the map area.

FEMA

Sandy Response

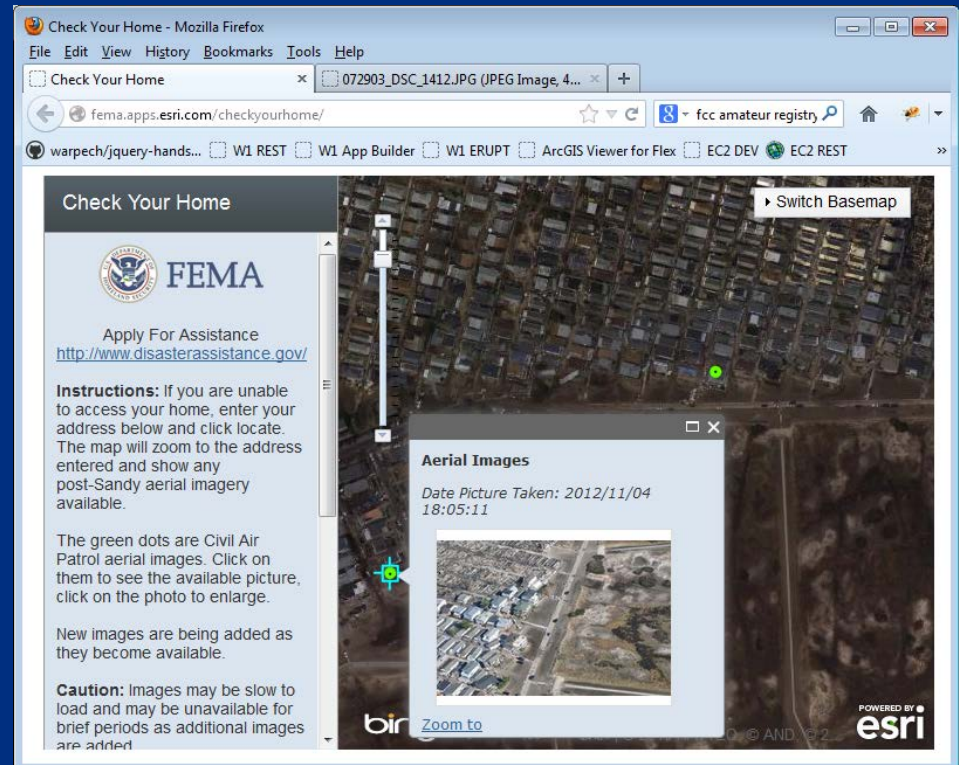

- Image Assessments posted to FEMA GeoPlatform for use by States and other Agencies
 - Damage Assessments compiled by US National Grid
 - Imagery-based Preliminary Damage Assessments

FEMA

Sandy Response

- Application Developed within 48 hours of request
- Leveraged NOAA imagery, BING base maps and CAP imagery
- Developed so people who could not go to their homes could see them
- Typing in address marks NOAA image (with underlying map)
- Click on green CAP image dot to see thumbnail image
- Click on thumbnail to see larger image
- Over 16,000 visits the first day

Sandy Response

- Post-Sandy LiDAR surveys (both topographic and topobathy) were taken of open coast sandy beaches from Cape Hatteras, NC to Montauk, NY
- Was done cooperatively:
 - USACE assets and contracts
 - USGS assets and contracts
 - Covered New York to Virginia
 - NOAA will follow up with coverage from South Carolina to New York using supplemental funding

FEMA

Sandy Response

- Day 3: Fuel flow into NY area was a top priority
 - Barge deliveries were hampered by partial closure of the port
 - Waterborne obstructions along Arthur Kill and other off-load facilities also a problem
- DHS requested maps of fuel depots and details of New York Harbor
 - HSIP has locations of fuel depots
 - EPA has capacity of fuel depots
 - NOAA has nautical charts (but not GIS-compatible)
- NOAA had survey vessels in the area, which were used to identify obstructions (using sonar technology) and clear areas for vessel movement

In Memoriam: Chris Barnard

In tribute to Chris Barnard, Remote Sensing Advisor for the Department of Homeland Security and a champion of geospatial coordination and innovation in disaster response.
